Head-mounted Vision System

features integrated light and camera system

A miniaturised head-mounted vision system, the Varioscope M5 combines the traditional Varioscope features of autofocus, zoom and parallax control with coaxial light for shadow-free illumination of the operating field and an integrated camera system for documentation from the surgeon's point of view. The autofocus function provides a very clear, 3D image at working distances from 300 mm to 700 mm. The field of vision extends between 30 mm and 224 mm, and the zoom operates in a stepless fashion from 2.0 to 9.0. With the integration of special functions, such as variable pupillary distance and individual vision correction, the system can be adjusted quickly to each user.
